WORKSHEET A

Can you identify the following? It is something that is often described as a vegetable, though more accurately it is the tuber of a plant. It is the world's fourth most important crop after rice, wheat, and corn, and is so popular that average consumption is about 30 kilograms per year for every person on the planet. It is inedible when raw, but there are many different ways to cook it. In fast-food restaurants you will usually find it cut into quite small pieces and deep-fried.

It is, of course, the potato.

Potatoes might not be the most glamorous food, but they are loved by millions, and have become part of everyday life in many parts of the world, which is shown by the number of slang words for them – “spuds” and “taters” are examples in English.

Potato consumption per person is highest in Europe and North America, which are parts of the world where potatoes have not always grown. In fact, potatoes originally grew only in the Andes Mountains in what is now Peru and Chile. No European had seen or tasted them until the Spanish *conquistadores* arrived in South America in the sixteenth century. The Spanish soon realized how important potatoes were in the local culture – the Inca people of Peru, for example, measured time by how long it took to cook a pot of them. The Spanish took some potatoes back to the royal court for the King to taste, and after that it wasn't long until they were being shipped to ports all over the world.

Part of the popularity of potatoes comes from the fact that they are very versatile. They can, for example, be boiled in water, baked in an oven, or fried. Most potato dishes are hot, but sometimes cooked potatoes are eaten cold – for example, in potato salad, or as the popular but not very healthy snack, usually sold in packages, called “chips.”

Other advantages of the potato are that it can be grown in different climates, and that for the same amount of water, it produces more energy than any other major crop, including rice, wheat, and corn.

In fact, because of its great value as a food, the United Nations officially made 2008 the International Year of the Potato – which might have helped the humble spud to become just a bit more glamorous.
